Defects resolved

- **Appointment Reminders:** Appointment reminder emails that use a template with more than one inline picture now show every image. Previously only one image appeared and the others were broken.
- **License Management:** The Total Active Licenses number in License Management now includes all licenses currently in use, even those with no Platform listed. Previously those entries were left out, so the total could appear lower than the number of licenses actually in use and make it look like some were still available.
- **Patient Overview:** When you added a new patient, chose an existing person as the responsible party, selected a provider, and saved, an error message appeared even though the patient was saved. The error no longer appears, so you get a clear result when the save completes.
- **Setup > Employees:** When assigning locations to an employee on Setup > Employees, the Locations dropdown now shows only the locations you are allowed to use. Saving will no longer add or remove assignments for locations you cannot access, so those existing assignments stay as they were. Assignments for locations you can access work as before.
