# Feature enhancements

## Imaging: More Screen Space for XVWeb Inside Denticon

### What's new

The extra frame and tab around XVWeb in Denticon have been removed, the redundant Launch in New Window button is gone (it now lives in the XVWeb header), and the footer gap when the patient header is collapsed is fixed. Both the x-ray tab and main screen now dynamically size so the imaging workspace works correctly on all resolutions and when resizing the window.

### Why this matters

Clinicians get a larger, cleaner imaging workspace without leaving the patient record.

**Who this affects**

Practices that use XVWeb imaging inside Denticon.

**What to expect**

XVWeb fills more of the screen. Use the open-in-new-window icon in the XVWeb header next to the bell icon.

**Action required:** No action required.

### DentalOS Username Available in Denticon

**What's new**

Denticon now displays a DentalOS Username field alongside the Denticon Username. When a DentalOS username exceeds Denticon's 15-character limit, Denticon maintains both values so linked users can be identified correctly throughout the system.

**Why this matters**

Because Denticon uses the Denticon Username in the audit trail and throughout the system, displaying the linked DentalOS username makes it easy to confirm which account a user belongs to when the two usernames differ.

**Who this affects**

DentalOS customers who also have Denticon access.

**What to expect**

Linked users' DentalOS usernames appear in Denticon. There is no change to how users sign in.

**Action required:** No action required.

## Defects resolved

- **Advanced Charting**: Tooth number now displays in Tooth History for procedures added through the Completed or TxPlan tabs, or through Transactions → Treatment Plan.
- **Batch Claims**: When a card is declined during Batch Insurance Payment, the page now displays the payment processor's reason when one is available, rather than showing only "Create Sale failed."
- **Claims**: Declined claim creation—when an insurance plan is set to "Do not submit a claim," or a supplemental-only plan has no eligible supplemental fees—now shows an inline message in Transaction Entry instead of navigating to a blank claim details page.
- **Electronic Claims**: DXC electronic claims now build their permanent missing-teeth list from the same source as the printed ADA claim, including completed extractions. Teeth later restored with an implant or bridge no longer appear as missing.
- **Appointments**: Appointment Quick Add now retains both the quadrant and tooth number for procedures that require both. Both values display correctly when the procedure is reopened.
- **Automated Reminders**: Fixed an issue where appointments scheduled before 8:00 AM did not receive automated reminders.
- **Find Slot**: Fixed an issue where Find Slot returned available openings during an office-wide holiday when the provider had no separate personal holiday entered.

- **New Patient Wizard**: Fixed an issue where finishing the new-patient wizard for a scheduled appointment did not open that appointment, and could open the wrong appointment on a later visit.
- **Patient Overview**: Fixed an issue where a patient's flash alert did not appear when Patient Overview was opened from certain other screens.
- **Patient Overview**: Fixed an issue where links from other screens into Patient Overview lost context, such as which appointment to open.
- **Reports**: The Executive Day Sheet now calculates ending accounts receivable for the selected end date independently of the start date, and correctly accounts for insurance payments on debit adjustments.
- **Reports**: The Walkout Report, statements, and Aging Report no longer double-count charges when insurance credits for a charge are associated with multiple claims.
- **Restorative Chart**: Fixed an issue where the Restorative Chart failed to load if the AI Assist service could not be reached, including for practices that do not use AI Assist.
- **Scheduler**: Fixed an issue where office holidays appeared open in the 7-day provider view and allowed appointments to be booked. Office holidays now display with the holiday watermark and block booking.
- **Security List Reports**: Fixed an issue where browsers could keep an older script alongside a newly released one, causing Security List Reports to fail to load after a release.
- **Transactions**: Fixed an issue where Certified Registered Nurse Anesthetist providers could be selected when posting procedures but not when posting payments or adjustments.
- **Treatment Plans**: Re-estimating a treatment plan now preserves manually entered medical and dental cross-codes on procedures.
- **VBS Verification Report**: Fixed an issue where opening the VBS Verification Report at a practice not set up for VBS showed an error page instead of the report's search screen.
